APPENDICES

Appendix A: Evolution of Spotted Hyena population in HiP

Figure 33 - Census estimates of Spotted Hyena population in HiP from 2003 to 2015 (EKZNW, 2015).

Figure 34 – Location of the call-ins station for censusing spotted hyena population in HiP, and number of spotted hyenas having responded in 2010 (A) and 2015 (B) (EKZNW, 2015).

Appendix B: Landmark displacements on 2D-entities

Fixed landmarks were initially digitized in *Geomorph* using the function `digitize2d`. The coordinates of the curve-sliders were exported from ImageJ, as suggested by Sherratt (2015), and joined to the coordinates of the fixed landmarks in a same *Geomorph* array. But after the Procrustes superimposition, displacements such as the one displayed by Figure 34 A, occurred for every pad. We assumed it was due to a modification of the scale of the image when it was imported in *Geomorph*. This scaling issue could not be solved at the time.

To get around this, fixed landmarks were digitized and exported from ImageJ (as for the curve-sliders), so that the same scale could be guaranteed for both types of landmarks. It worked for the main pads and toes 1 (Figure 34 B), but not for toes 2, 3 and 4, as displacements such as the one displayed by Figure 34 C kept occurring after the Procrustes superimposition. However, when the coordinates of the landmarks of the pads were grouped all together to represent the entire segmented track, no displacement occurred for any of the pad (Figure 34 D), although the same *.txt files containing the same coordinates were used both for the independent pads and for the entire track.

As this displacement issue could not be solved at the time, the scenarios involving the combination “2D –fixed+curve – independent pads” was not conducted and compared to the others.

Figure 35 - Displacements between mean configurations of fixed landmarks and curve-sliders in 2D. Each grey dot corresponds to the Procrustes coordinates of a landmark of a specimen; the black dots represent the landmarks of the mean shape. The straight lines connect the fixed landmarks of the mean shape to each other, while the curved lines surround the mean configuration characterized by the curve-sliders. Displacements between the two types of landmarks occurred when fixed landmarks were digitized in Geomorph (A), but not when they were positioned in ImageJ and exported as *.txt file. This was the case for main pads (B) and toes 1, but not for toes 2, 3 and 4, for which displacements kept occurring (C). However, when Procrustes superimposition was applied on the entire track, there was no displacement for any of the pads (D), although the coordinates of the landmarks originated from the same *.txt files both for the independent pads and for the entire track.

Appendix C: *Photoscan* parameters

Figure 36 - Parameters applied during the “Camera Alignment”, “Build Dense Point”, and “Build Mesh” steps of the 3D-modelling process in *Photoscan*.

Appendix D: 2D and 3D arrays in *Geomorph*

Figure 37 – Schematic of 2D (A) and 3D (B) arrays, two formats used for data treatment in *Geomorph*, both for 2D and 3D landmarks. (Sherratt, 2015).

Appendix E: Procrustes ANOVA

Table 6 - Results of the Procrustes ANOVAs conducted on the different 2D objects (entire track, main pad (MP), or one of the four toes (T1 to T4)) which were characterized by fixed landmarks only (fixed) or by fixed landmarks and curve-sliders (“fixed+curve”).

Appendix G: PCA plots

Figure 38 – Principal Components Analyses conducted on main pads. Figures A and B display the PCA conducted on data that were extracted using fixed landmarks on 2D- and 3D-models respectively. Figures C and D display the PCA conducted on data that were extracted using fixed landmarks and curve-sliders on 2D- and 3D-models respectively. Figure E displays the PCA conducted on data that were extracted using fixed landmarks, curve- and surface-sliders on 3D-models. The colour code corresponds to the different track positions: red for Front Left (“FL”), green for Front Right (“FR”), blue for Hind Left (“HL”), and purple for Hind Right (“HR”).

Figure 39 - Principal Components Analyses conducted on toes 1. Figures A and B display the PCA conducted on data that were extracted using fixed landmarks on 2D- and 3D-models respectively. Figures C and D display the PCA conducted on data that were extracted using fixed landmarks and curve-sliders on 2D- and 3D-models respectively. Figure E displays the PCA conducted on data that were extracted using fixed landmarks, curve- and surface-sliders on 3D-models. The colour code corresponds to the different track positions: red for Front Left (“FL”), green for Front Right (“FR”), blue for Hind Left (“HL”), and purple for Hind Right (“HR”).

Figure 40 - Principal Components Analyses conducted on toes 2. Figures A and B display the PCA conducted on data that were extracted using fixed landmarks on 2D- and 3D-models respectively. Figure C displays the PCA conducted on data that were extracted using fixed landmarks and curve-sliders on 3D-models. Figure D displays the PCA conducted on data that were extracted using fixed landmarks, curve- and surface-sliders on 3D-models. The colour code corresponds to the different track positions: red for Front Left ("FL"), green for Front Right ("FR"), blue for Hind Left ("HL"), and purple for Hind Right ("HR").

Figure 41 - Principal Components Analyses conducted on toes 3. Figures A and B display the PCA conducted on data that were extracted using fixed landmarks on 2D- and 3D-models respectively. Figure C displays the PCA conducted on data that were extracted using fixed landmarks and curve-sliders on 3D-models. Figure D displays the PCA conducted on data that were extracted using fixed landmarks, curve- and surface-sliders on 3D-models. The colour code corresponds to the different track positions: red for Front Left ("FL"), green for Front Right ("FR"), blue for Hind Left ("HL"), and purple for Hind Right ("HR").

Figure 42 - Principal Components Analyses conducted on toes 4. Figures A and B display the PCA conducted on data that were extracted using fixed landmarks on 2D- and 3D-models respectively. Figure C displays the PCA conducted on data that were extracted using fixed landmarks and curve-sliders on 3D-models. Figure D displays the PCA conducted on data that were extracted using fixed landmarks, curve- and surface-sliders on 3D-models. The colour code corresponds to the different track positions: red for Front Left (“FL”), green for Front Right (“FR”), blue for Hind Left (“HL”), and purple for Hind Right (“HR”).

Figure 43 – Principal Components Analysis conducted on entire tracks, on which traditional morphometrics (fixed landmarks) was applied to extract data from 2D (A) and 3D (B) entire tracks. red for Front Left (“FL”), green for Front Right (“FR”), blue for Hind Left (“HL”), and purple for Hind Right (“HR”).

Figure 44 - Principal Components Analyses conducted on entire tracks. Figures A and B display the PCA conducted on data that were extracted using fixed landmarks on 2D- and 3D-models respectively. Figures C and D display the PCA conducted on data that were extracted using fixed landmarks and curve-sliders on 2D- and 3D-models respectively. Figure E displays the PCA conducted on data that were extracted using fixed landmarks, curve- and surface-sliders on 3D-models. The colour code corresponds to the different track positions: red for Front Left (“FL”), green for Front Right (“FR”), blue for Hind Left (“HL”), and purple for Hind Right (“HR”).

Appendix H: accuracies of prediction

Table 18 – Accuracy of prediction (in %) of the algorithms resulting from the LDA conducted on the scenarios that involved geometric morphometric analyses on 2D-models. The objects (“pads” or “track”) were characterized either by fixed landmarks only (“fixed”) or fixed landmarks and curve-sliders (“fixed+curve”). The variables taken into account by the algorithms were the centroid size only (“Csize”), the shape components only (“shape”), or both at the same time (“Shape&Size”).

Type of model		Two-dimension					
Feature extraction		Geometric Morphometrics

Table 20 - Accuracy of prediction (in %) of the algorithms resulting from the LDA conducted on the scenarios that involved traditional morphometrics analyses on 2D and 3D models (“fixed” landmarks only, positioned either on “pads” or “tracks”) and geometric morphometrics on 3D models (fixed landmarks and curve- and surface-sliders (“fixed+curve+surface”), positioned either on “pads” or “tracks”). In traditional morphometrics, the variables considered by the algorithms were the distances between each landmark. In geometric morphometrics, the variables considered by the algorithms were the centroid size only (“Csize”), the shape components only (“shape”), or both at the same time (“Shape&Size”).

Type of model	Two-dimension		Three-dimension		Three-dimension				
Feature extraction	Traditional morphometrics				Geometric morphometrics				
Type of landmarks	fixed				fixed + curve + surface				
Type of object	pad		track		pad		track		
Type of variable	Distance	Distance	Distance	Distance	Csize = 45.00		Csize = 26.25		
					Shape	Shape&Size	Shape	Shape&Size	
Number of PC used by the algorithm	1	51.25	51.25	30.00	27.50	25.00	26.25	67.50	67.50
